

SPACER FOR SLABS COCOPEAT

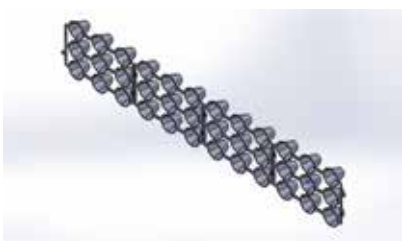

The new design of the registered spacer manages to raise the coconut board above the culture channel, allowing a correct drainage and favouring the water course. Its new design prevents breaks in the plastic channel, not damaging it.

BENEFITS OF HYDROPONIC CULTIVATION:

- ✓ **Independence from the ground**, avoiding pest problems and allowing a better plants' control
- ✓ **Reduced water consumption** and fertiliser's optimization, as a result of recollection and recirculation irrigation drainages
- ✓ The separators permit a **better ventilation** between the channel and the substrate, avoiding the obstructions
- ✓ **Adaptability to available space**; the separators connect easily, in order to achieve the adequate length to each channel
